We're using the Free Trial version, and as it's available for all files, we're able to use it to check the integrity of some downloaded files and some sent by email. We're also having a look at the export feature. The base64 option is useful for writing confidential messages on websites or social networks, and it does its job with ease, keeping all content hidden. The only drawback is the log window, which isn't especially big, and a few seconds later it's cleared to let us check other files. It's easy to record the entire process, but there's no help on the topic, and a little trial and error will be needed to find out how to keep it saved. Nevertheless, XHash is a well-designed program, and should be considered an option for you. Also see We've checked out many of these, and one of them is a good possibility for generating HASH values. If you're looking for an easy way to identify the file integrity of the files you download or receive, this utility will suit you well. It is easy to use, it is very simple, and works from the menu. XHash Description: - Free Trial - Generates HASH values

XHash Activation Code Free [Win/Mac]

Keymacro is the result of collaboration between DJ Taj and CrypticNinja, two extremely talented security researchers and programmers. Keymacro is capable of generating and manipulating password files. This includes the ability to create a password database from the existing password files of a system. Keymacro has a user-friendly interface and is capable of working with any file format, making it capable of generating keyfiles for nearly any OS, also known as PKL files. This is great news for people who have used the classic PKL Generator to extract the keyfile information from a password database, since the last release of PKL Generator can be found here. Keymacro is currently available for Windows systems only and does not currently contain a built in plugin system.
